304 Final Build Report
ID: 32356918

A few things I noticed for my final build:

- In the videos submitted the numbers appear not at the same time on the 7-segment display. However, this is not the case in real life. Instead the numbers are flashing as the counter for the OLED as well as the 7 segment is being passed in the loop every 10 times in the loop function.
- The sonar cannot detect anything passed 8.7 ft. I assume this has nothing to do with my system but the sonar device that was provided to us. I have provided both videos, one explaining the functionality of my build with a lower red light distance of 4 ft and a max of the green light 8ft , the other showing the PDR specified 6 ft to 10 ft distances.

Otherwise the build was successful with a battery as a power source. Just hoped the sonar would have cooperated more with me than anticipated.
